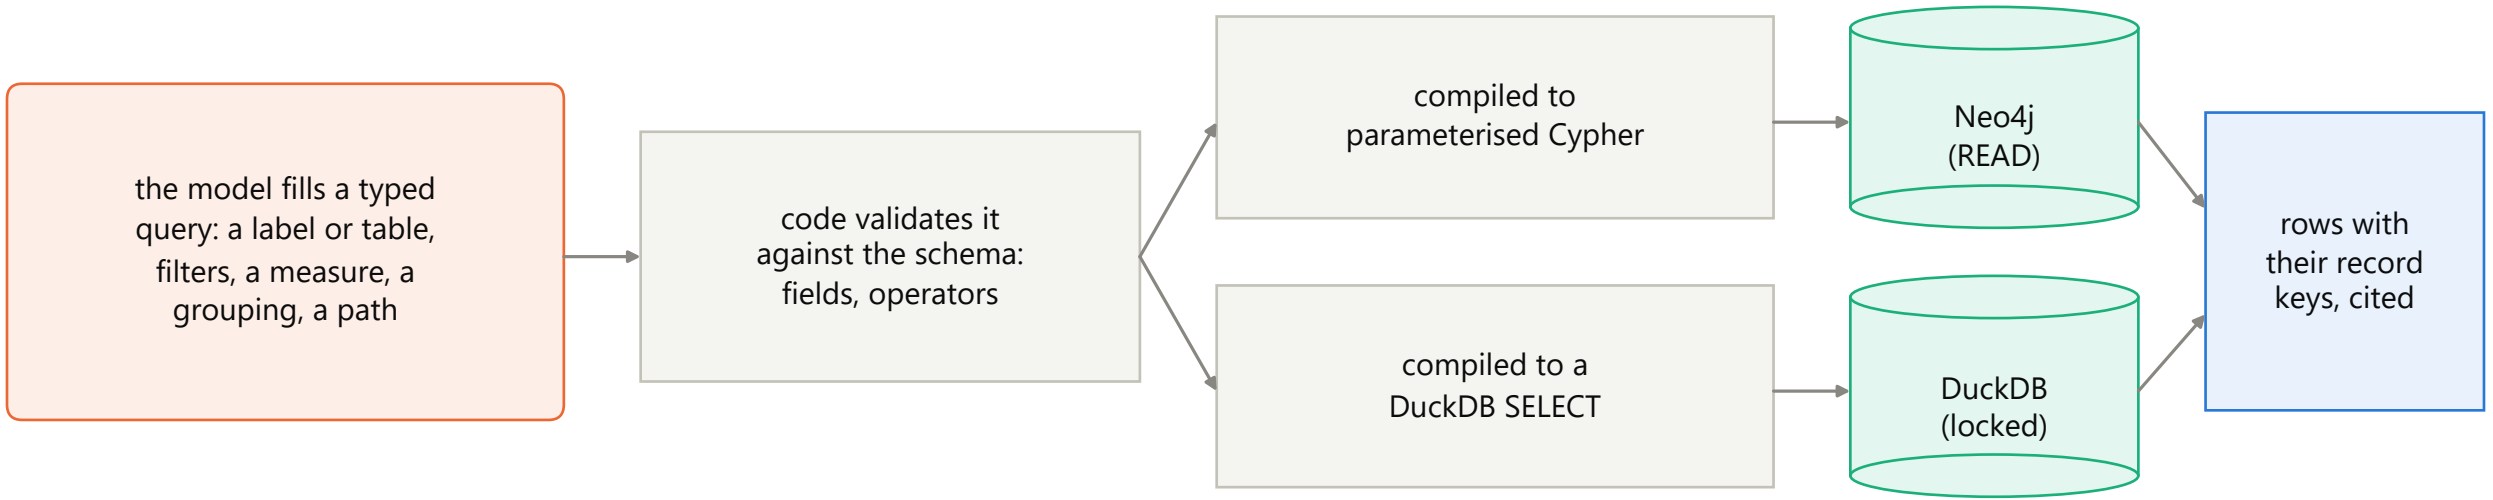
Measures: rows, count, sum, average, min, max, distinct. Filters: equals, comparisons, in, contains, whole word, empty cell; one field against another. Group by a field or by year or decade; paths of up to three relationships; paging.



Measured, not adopted (agent_sql): the model writes one SELECT; DuckDB's own parser checks it is a single read-only statement over the known tables (no table functions, no other schemas); it runs on locked, offline tables with a time-out.
