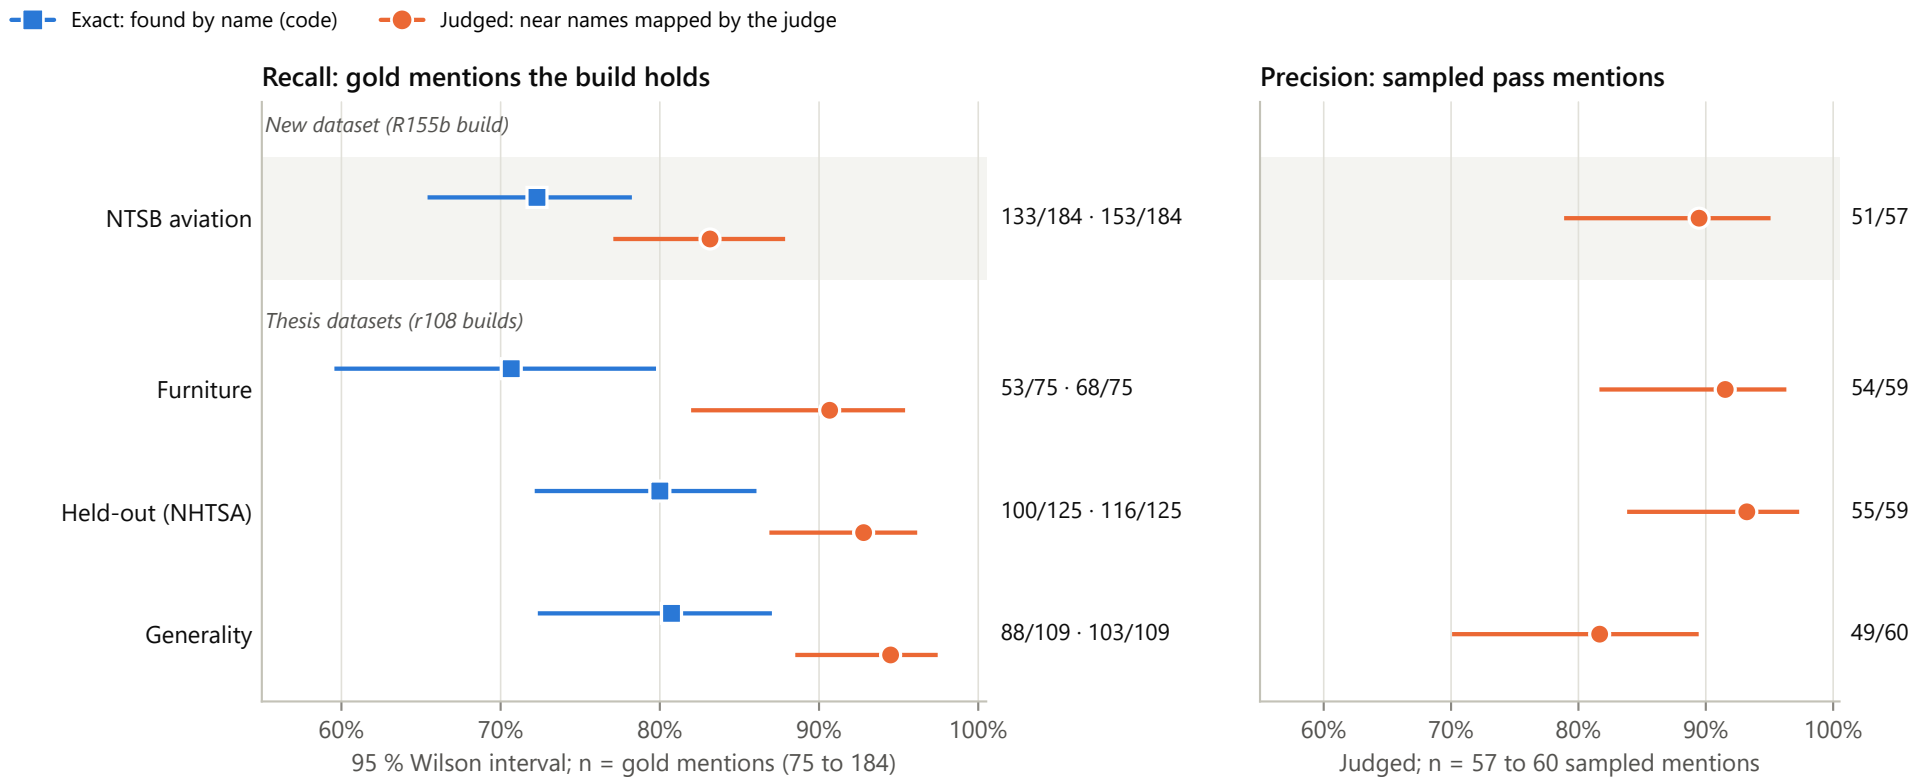
The mention index finds 83%-94% of what a reader names, and most of what it adds is a real mention


Selected comparison of 4 of the 5 measured datasets; see the captions.
R103 (thesis datasets, the pass r108 reused) and R226: 40 random sentences per dataset with every mention a reader names (R101 / R225 gold, written blind).
Left: found by exact name (square, code) and with near names the judge mapped (circle). Right: a seeded sample of the pass's own mentions judged inside the definition.
