On unseen questions the agent answers 195/200, 77/80, 78/80 right by meaning on the four datasets

Four datasets: NTSB, furniture, held-out, generality. Three measurements in time order, each on its own questions written before any output: the frozen engine (R157), and before and after the R167-R170 fixes (R166, R173).
Each row: exact match (square) above the score by meaning (circle); lines are 95 % Wilson intervals; the counts at right are k/n. The axis starts at 75 %. The question sets differ, so a difference is not attributed to the fixes.
